BANANASPLIT · LINUX

BananaSplit on this machine

BananaSplit 2.8.5 (.deb from the GitHub release) · PipeWire, 48 kHz · checked 27 Oct 2026, 16:13–16:40, 12 h 13 min into one recording

In short: BananaSplit has been running and recording without a break since **04:24:32**. All **12 finished hourly files are exactly 1 hour long and decode without a single error**, and the recording has **0 dropped and 0 clipped samples**. Memory use has **levelled off at about 270 MB** (no leak). One thing uses more than it should: the mixer window's web view keeps **about one CPU core busy** while the window is open (section 3).

1. How it's set up

What	Setting
Installed from	The `.deb` on GitHub (`/usr/bin/bananasplit`). There's also a Flatpak (`io.github.LudaLunizz.BananaSplit` 2.8.5) installed, but it isn't the one running.
Starts with	The desktop login (`~/.config/autostart/bananasplit.desktop`, runs `--gui --hidden`, so it starts in the tray).
Settings	`~/.config/bananasplit/bananasplit.ini`
Audio	48 kHz, buffer 128 samples (2.67 ms), round trip 6 ms. 11 virtual cables (inputs `BananaSplit-In1…In6`, outputs A1–A3, B1, B2).
Channels	Mic, Discord, Desktop, Game, Music, Aux → buses Speakers, Headphones, A3, Virtual B1, Virtual B2
Recording	The mix as one MP3, 320 kbit/s, 48 kHz stereo, a new file every hour (`_part2`, `_part3`, …)
Recordings folder	`/run/media/ludalunizz/winExtra/outputblendervid/voicerecs` (89 takes)
Web interface	`http://127.0.0.1:8790/`, only reachable from this PC

2. Memory (RAM)

BananaSplit runs as several processes. Measured as PSS (each process's fair share of shared memory, so the numbers add up correctly):

Process	What it does	RAM
`bananasplit --gui`	The audio engine, cables and recorder	28 MB
`bananasplit --window`	The mixer window	70 MB
WebKitWebProcess	Draws the window's contents (meters, faders)	154 MB
WebKitNetworkProcess	The window's connection to the engine	19 MB
Total		**about 271 MB**

Running for	**1 h 22 min**	**2 h 30 min**	**11 h 49 min**
Total RAM	227 MB	261 MB	271 MB

It grew in the first hours (almost all of it the web view) and then stopped: only 10 MB in the last 9 hours. That's normal settling, not a leak. The audio engine itself stays under 30 MB. None of BananaSplit is in swap. (The PC's 4 GB swap is full, but no program has more than 20 MB in it; with 19 GB of RAM still available, that's harmless.)

3. Processor (CPU)

Process	CPU time in 12 h 13 min	Average	Right now
Audio engine	18.5 min	2.5% of one core	about 3%
Mixer window	20.3 min	2.8% of one core	about 7%
WebKitWebProcess	**7 h 39 min**	**62% of one core**	**about 93%**

The engine's own audio load is **4%** (the "cpu" figure in the mixer). The Ryzen 9 5900X has 24 threads, so one busy core is about 4% of the whole processor. You won't notice it, but it is wasted work and extra heat. It's the web view redrawing the level meters while the window is open. The window was opened when the in-app update to 2.8.5 restarted BananaSplit at 04:24 (that restart starts with the window shown, not in the tray). **Close the window to the tray** (X button; "close to tray" is on) to see if this drops. Recording carries on either way. Making the meters cheaper is a candidate for a next version.

4. Audio and recording

Check	Result
Recording time	12 h 13 min 47 s, no break
Hourly files	12 finished, each **3600.000 s** and 144.0 MB; the 13th is being written. 1.7 GB so far.
Decode test (`ffmpeg`, all 12 files)	**0 errors**
Dropped / clipped samples in the recording	0 / 0
Audio dropouts (xruns)	23 in 12 hours, about 2 per hour. Short PipeWire hiccups (usually when the PC is busy), not lost recording.
Free space on winExtra	2.2 TB, about 16,000 hours of MP3 at this rate

The status line says the system's default input and output are BananaSplit's own cables, so the Mic channel and the Speakers bus use the onboard sound card instead. That's intended: it stops BananaSplit from recording itself in a loop.

5. Version and updates

- **Running: 2.8.5. Latest: 2.8.6** (27 Oct, the fixes from the 2.8.2 review). Not updated yet, because updating restarts BananaSplit and cuts the running recording.
- Automatic update checks are off, so the mixer doesn't show 2.8.6 yet. When you stop recording, update with the in-app updater, the same way you went to 2.8.5.
- After an in-app update, BananaSplit comes back with the window open. Close it to the tray (section 3).
- Updates are only installed if their signature checks out (Ed25519, key kept off GitHub).

6. Useful commands

```
# is it running, and since when?
ps -o pid,etime,cmd -C bananasplit
# RAM per process (PSS, MB)
for p in $(pgrep -f 'bananasplit|WebKit'); do echo "$(( $(awk '/^Pss:/{print $2}' /proc/$p/
smaps_rollup)/1024 )) MB $(cat /proc/$p/comm)"; done
# which file is it recording to right now?
ls -l /proc/$(pgrep -f -- 'bananasplit --gui')/fd | grep voicerecs
# check a finished hourly file (should say 3600.000000)
ffprobe -v error -show_entries format=duration -of csv=p=0 FILE.mp3
# quit cleanly, start again in the tray
bananasplit --quit; setsid -f /usr/bin/bananasplit --gui --hidden
```
